

# Space Nuclear Propulsion for Deep Space Missions

If a nuclear propulsion option existed, what could be done?

## Nuclear Thermal Propulsion (NTP)

- Substantial departure thrust (10-15 klb<sub>f</sub> thrust), improved specific impulse (900 s I<sub>sp</sub>) compared to chemical
- Significantly reduced trip times
- Greater payload mass delivery

NTP efforts underway

- NASA Space Nuclear Propulsion Project
- DARPA DRACO in-space demonstration

## Nuclear Electric Propulsion (NEP)

- 10 kW<sub>e</sub>-class, 2,000-8,000 s I<sub>sp</sub>
- Greater payload mass delivery
- Power at destination far in excess of radioisotope systems
- Potential for multi-body rendezvous and orbital insertion on one mission

NEP developments and recent risk reduction demos

- Demonstration Using Flattop Fission (DUFF)
- Kilopower Reactor Using Stirling TechnologY (KRUSTY)
- AFRL JETSON in-space demonstration
- NASA Space Nuclear Propulsion Project
