

DAVINCI

In the early 2030s, NASA's DAVINCI mission will drop a spacecraft into Venus' thick atmosphere. As it descends, DAVINCI will study Venus in extraordinary detail from the top of the clouds to the planet's surface. The mission's goal is to help answer long-standing questions about our neighboring planet, especially whether Venus was ever wet and habitable like Earth.

Use this space to draw what you think you could find on Venus.
